Get to know the location

The Brixen railway station was put into service in 1867 together with the entire section of the Brenner railway between Innsbruck and Bolzano. Bombardments during the Second World War destroyed part of the reception building, which was subsequently rebuilt with a northern extension. In 1967, the building was renovated and internally redesigned. Only in 1907/08 a road was built in place of the previous dirt road from the town to the station. In 2021, the realisation of the mobility centre and the redesign of the station square began, both of which are intended to enhance the city.

Technical details

Energy

Energy point is very flexible and not at a fixed location in this venue.

Single- and Three-Phase power available. Schuko and CEE plugs can be provided.

At this location we would like to pay special attention to sustainability. For this reason, we would like to work in a power-saving way. To make the installation look better in the dark, we will turn off some streetlights of the public lighting. These lanterns would have a power consumption of about 200W. For this reason, the installation itself must not require more than 200W, or must generate the required energy itself, for example, by solar panels.

Link to location on Google Maps: <https://goo.gl/maps/ZGQoTd2tbHC57wqJ7>

**The train station in Brixen was renovated recently and Google Maps and Street view are not updated. This means that Google Maps is not the most accurate source for this venue.*

Fixing points

The surrounding trees and lanterns can be used as fixing points. With prior permission it is also possible to use the adjacent building of the station for fixing.

Technical restrictions

- No video mapping or projection.
- The installation should not restrict the movement of people at the square.
- No new fixing points should be added in the walls of the surrounding buildings.
